

QfO SwissTrees: Sequence identity

Descriptive differences versus full OrthoFinder 3.1.5; no subgroup confidence intervals or significance tests.

● Lower identity (9 families) ■ Higher identity (9 families)

Development-exposed associations, not causal effects. F1 is harmonic macro precision/recall; panels use separate x-axis ranges.

*Sequence-only OrthoFinder uses group-clique pairs. FastOMA uses a supplied tree. Configuration contrasts are not pure ablations.

Family mean identity median: 0.429122; 9 families per bin. Alignment-dependent identity is not calibrated evolutionary distance.

Missing-identity bin: 0 families. All 18-family scores and empty-bin rows remain in the source table.
