

QfO SwissTrees: mapped-tree duplication annotations

Descriptive differences versus full OrthoFinder 3.1.5; no subgroup intervals or significance tests.

● Lower annotation fraction (9 families) ■ Higher annotation fraction (9 families)

Development-exposed associations, not causal effects. F1 is harmonic macro precision/recall; all panels share the same x-axis scale.

*Sequence-only OrthoFinder uses group-clique pairs. FastOMA uses a supplied tree. Configuration contrasts are not pure ablations.

Feature: explicit duplication annotations / informative mapped nodes; median 7/48. Not an evolutionary duplication rate.

Default-S nodes are not explicit speciation evidence. Missing bin: 0 families. Full-panel and empty-bin scores remain in the source table.
