

Simulation sensitivity to supplied species trees

70 datasets | 560 planned method/tree outcomes | 23 failures retained | 126 exploratory endpoints

● OrthoHMM satellite_v2 ■ OrthoFinder full 3.1.5

Dots/squares: paired-seed means. Thick: nominal 95% CI. Thin: Bonferroni CI across all 126 endpoints.

20,000 paired-seed draws; seed 20260918. Available paired counts: 5, 8, 9, 10. Failures are not assigned zero accuracy.

Generating tree is an oracle diagnostic. Retained upstream differences and per-contrast exclusions are reported in the accompanying audit.

Development-exposed simplified simulations; small seed counts and approximate bootstrap tails limit generalization and simultaneous coverage.
