

SwissTrees: domain-stratified method differences

18 curated families | 100,000 paired family resamples within bins | 27 planned endpoints

OrthoHMM high sensitivity and phylogeny configurations; reference: full OrthoFinder 3.1.5.

Thick lines: nominal 95% intervals. Thin lines: Bonferroni-adjusted intervals across all 27 endpoints. Points: observed differences.

All nine adjusted interaction intervals include zero; different within-bin results do not establish a difference between bins.

Retrospective, development-exposed analysis; possible family dependence. Domain annotations do not establish causal mechanisms.

OrthoHMM configurations differ beyond reconciliation. F1 is harmonic macro precision/recall. Repeat-type bins are descriptive only and not plotted.
