

Native SwissTrees fixed-stratum contrasts

Initial HMM search on; downstream profile refinement off in all three cells

● F1 ■ Precision ▲ Recall

A Reconciliation minus baseline

B Candidate expansion minus baseline

Dots are descriptive changes, not confidence intervals. Axes use different ranges, both in percentage points.
 All 18 families are development-exposed; strata overlap. Empty bins and redundant all-family copies remain in the full tables.
 Length/composition, Pfam annotation and reference duplication descriptors are not causal biological validation.
