

SwissTrees: paired method differences

18 curated families | 100,000 paired family resamples | 24 planned metric contrasts

First seven rows: candidate minus full OrthoFinder 3.1.5. Last row: comparison of OrthoHMM configurations.

Thick lines: nominal 95% intervals. Thin lines: Bonferroni-adjusted intervals across 24 endpoints. Points: observed differences.

Retrospective, development-exposed estimates. Shared evolutionary history and merged predictions can correlate families.

* MCL checkpoint is diagnostic; FastOMA used a supplied OrthoFinder tree. OrthoHMM configurations differ beyond reconciliation.

F1 is the harmonic mean of macro precision and recall. Intervals do not cover other QfO metrics or the six-metric secondary mean.
