

Accepted candidate events: descriptive VGNC associations

Each accepted event once. Lines = observed minimum to maximum; dots = median. These are not confidence intervals.

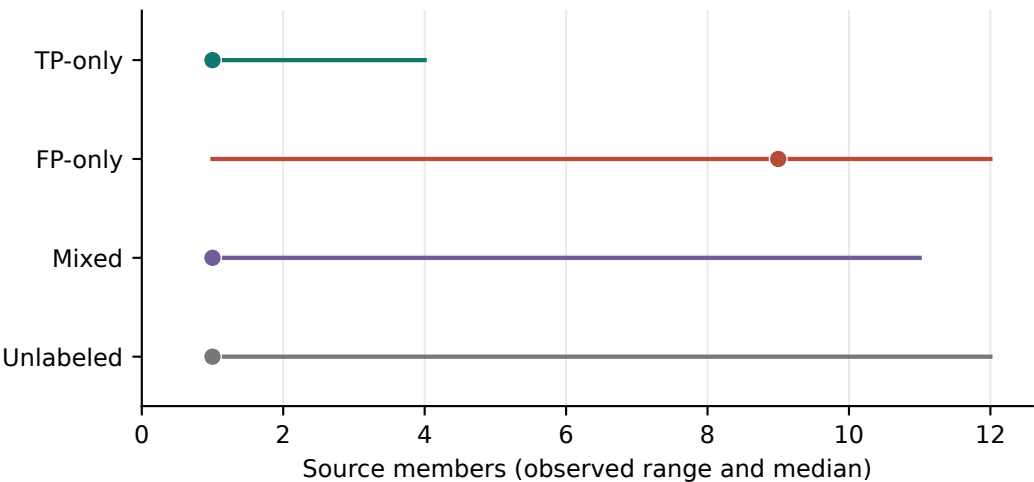

A Accepted-event units

	All rounds	Round 0	Round 1
TP-only	51	49	2
FP-only	352	322	30
Mixed	46	37	9
Unlabeled	40,241	33,699	6,542

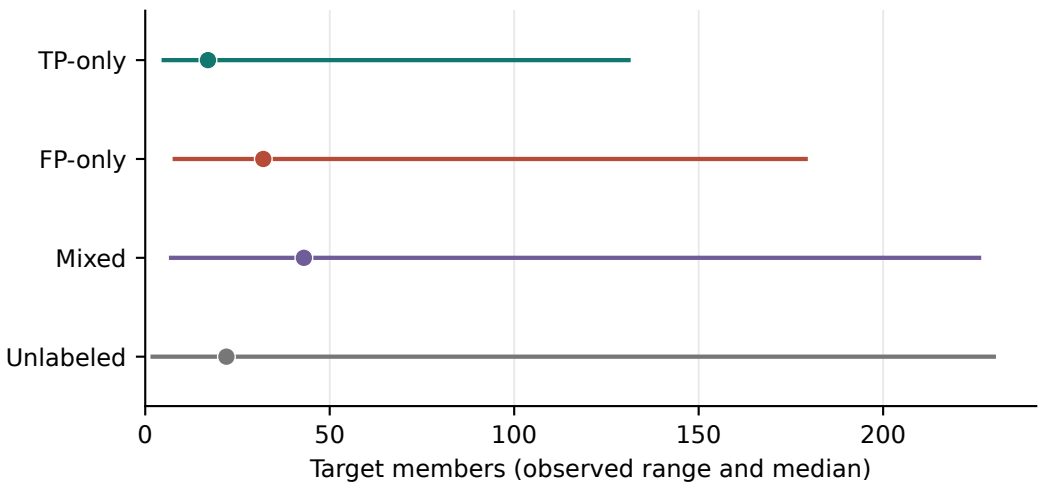

B Serialized event support

C Source-group size

D Target-group size

Cohorts refer only to changed scored pairs: TP-only, FP-only, mixed, or unlabeled. Unlabeled does not mean correct or true negative.

Transitive pairs have no assigned direct event. Accepted-event group support does not establish a direct protein-pair HMM hit.

Development-exposed; membership, group size and reference scope confound differences. No threshold, confidence or causal inference.
