

QfO SwissTrees: Historical fragment annotations

Descriptive differences versus full OrthoFinder 3.1.5; no subgroup confidence intervals or significance tests.

- Annotation-positive (5)
- Historical unflagged (13)
- ▲ Baseline-only unflagged (11)
- ◆ Baseline-only missing (2)

Development-exposed associations, not causal effects. F1 is harmonic macro precision/recall; panels use separate x-axis ranges.

*Sequence-only OrthoFinder uses group-clique pairs. FastOMA uses a supplied tree. Configuration contrasts are not pure ablations.

Unflagged is not proven complete. Baseline-only treats 14 later-version records as missing; two families leave the unflagged bin.

The positive bin is unchanged in the baseline-only view. Historical missing bin: 0 families. No points represent fabricated zero scores.
