

Corrected QfO SwissTrees: initial-search replacement

18 reference families | fixed downstream grouping and refinement | native macro statistic

Profile expansion, candidate expansion and phylogenetic reconciliation are off in every arm.

Initial search	F1 (%)	Precision (%)	Recall (%)
Initial HMM	68.92	64.39	74.13
DIAMOND: all hits	62.81	56.18	71.21
DIAMOND: top 100	62.92	56.18	71.49

Thick: paired 95% CI. Thin: Bonferroni CI over six endpoints. 100,000 family draws; seed 20260923.

Negative differences favor HMM. Adjusted F1 and recall intervals include zero; precision intervals do not.

Development-exposed control; equal E-values do not establish matched sensitivity or cost. No established HMM F1 advantage.
