

Corrected QfO SwissTrees: composition-stratified differences

100,000 paired family resamples within bins | 27 planned endpoints | full OrthoFinder 3.1.5

18 reference families; missing-composition bin: 0 (descriptive, not a primary interval).

Points: observed differences. Thick lines: nominal 95% intervals. Thin lines: Bonferroni intervals across 27 endpoints.

Development-exposed, conditional family bootstrap; composition strata are not causal explanations.

Configuration contrasts are not pure phylogeny ablations. F1 is harmonic macro precision/recall; missing intervals are never zero.
