

Native OrthoHMM ablation: QfO development set

Initial HMM search on; P = 0, C = 0. Showing two cells; 2/7 fresh cells admitted.

● R-off: group-clique pairs ● R-on: inferred pairs

D: thick = nominal 95% interval; thin = 42-endpoint adjusted interval. Retained draws reused only after exact family matches.

18 development-exposed SwissTrees families; conditional exchangeability and percentile-coverage limits. F1 adjusted interval includes zero.

No intervals for other QfO endpoints; unseeded FAS sample. Failed R-on inference timing excluded. Not a selected-default comparison.
