

Whole-genome-duplicate application

Development-exposed *Saccharomyces* data | all panels use the same 231 shared-pillar pairs

Homolog support is not copy-specific orthology truth. Coverage alone can reward merged paralogs.

Thick: nominal 95% interval. Thin: Bonferroni interval across 12 contrasts. 20,000 paired pillar resamples; seed 20260920.

The OrthoHMM configurations differ in more than reconciliation; their contrast is not a pure phylogeny ablation.

All 240 experimental pairs, exclusions, the diagnostic MCL checkpoint and individual memberships remain in the supplement.
